Podzolization (or Podsolization) is complex soil formation process by which dissolved organic matter and ions of iron and aluminium, released through weathering of various minerals, form organo-mineral complexes and are moved from the upper parts of the soil profile and deposit in the deeper parts of soil. Through this process, the eluvial horizon becomes bleached and of ash-grey colour.

Podzol - Wikipedia

Healthy garden soil is the basis of healthy plants and a healthy environment. When the soil is in good shape there is less need for fertilizers or pesticides.
